RTT™ SPEEDLOADER

In LogisticsHubs

A rugged loading arm built for high-throughput terminal operations.

Integrates into new or existing systems or runs standalone.

RTT™ SPEEDLOADER

In Airport Terminals, a rugged loading arm built for high-throughput terminal operations.

Integrates into new or existing systems or runs standalone.

HOW IT WORKS

Step 1

The loader uses one hand to steer The RTT into position.

Step 2

The loader then drags/pulls items onto it for unloading.

Or simply pushes the item into place for loading.

No lifting needed.

The Speedloader can also steer up, down, side to side, forwards or backwards.

BENEFITS

Reliable since 1986

Improved ergonomics

70% reduced physical strain for workers. With the RTT you achieve:

- No twisting. No
- lifting. Only push &
- pull.

Controlled by Loader

The RTT is completely controlled by the loader using handles on the ball tray.

- Enables faster throughput. Makes loading
- and unloading simpler.

Standalone or Integrated

We offer the RTT Speedloader as a standalone unit or integrated into your current system, depending on your needs.

- Allows simple integration into facilities. No matter the current layout. Opens the door for
- new operations.

Increased Revenue

With faster throughput and fewer injuries, customers report a significant increase in revenue from operating at a higher rate.

- Faster throughput increases operational capacity. Fewer injuries
- lead to drastic cost savings.

30% Faster Throughput

By drastically reducing the amount of movement and force required by the worker, cargo reaches the belt faster. Significantly increasing throughput.

- Less fatigue for workers. Cargo
- reaches the belt faster.

Short Learning Curve

Being controlled by the loader with two simple handles makes the learning curve very intuitive.

- Simply grab the handle and move in the desired direction. No need for lengthy,
- complicated, or expensive training.

A man with a beard, wearing a blue t-shirt, is working on a large, tilted metal structure in a warehouse. The structure has a dark, textured surface and is supported by a metal frame. In the background, there are shelves with cardboard boxes and a yellow vertical beam. The man is looking up at the structure, and his hands are near the bottom edge. The overall scene is a professional industrial setting.
